These PLP Reports are informal and preliminary and as such may contain errors not yet eliminated. They are for private circulation only and are not to be further transmitted without consent of the authors and major professor.
A new model for the magnetic field and current density profiles in a reversed field pinch is proposed. The model has finite beta, a relatively constant ratio of $j/B$ and vanishing current density at the wall. The fields and currents are simple polynomial functions of radius whose coefficients depend in a simple way on the field reversal parameter ($F$) and pinch parameter ($\Theta$). The profiles are used to derive expressions for many useful quantities such as magnetic energy, beta, inductance, resistance and ohmic input power. These quantities, in turn, are used for electrical circuit modeling of RFP discharges. Under some conditions the equations lead to an instability that is characterized by a peaking of the current density profile and an increase in beta reminiscent of the sawtooth oscillations often observed in RFP discharges. The conditions under which such instabilities are expected to occur will be discussed.
RFP Profile Models

The Modified Polynomial Function Model generalizes the Polynomial Function Model in the same way that the Modified Bessel Function Model generalizes the Bessel Function Model:

MPFM Expressions for $B(r)$ and $j(r)$

\[ B_{\phi} = B_{\phi}(0) \left[ 1 - \Theta_o^2(r/a)^2 + \Theta_o^2(r/a)^4/2 \right] \]

\[ B_\theta = B_{\phi}(0) \left( r/a \right) \left[ \Theta_o - (2\Theta_o - 3C) \left( r/a \right)^2 + (\Theta_o - 2C) \left( r/a \right)^4 \right] \]

\[ j_\phi = 2 \, B_{\phi}(0) \left[ \Theta_o - 2 \left( 2\Theta_o - 3C \right) \left( r/a \right)^2 + 3 \left( \Theta_o - 2C \right) \left( r/a \right)^4 \right] / \mu_o a \]

\[ j_\theta = 2 \, B_{\phi}(0) \, \Theta_o^2(r/a) \left[ 1 - (r/a)^2 \right] / \mu_o a \]

where

\[ C = B_\theta(a) / B_{\phi}(0), \quad \Theta_o = \mu_o a \, j_\phi(0) / 2 \, B_{\phi}(0). \]

\[ \Theta_o = \sqrt{\frac{6-6F}{3-2F}} \quad C = \frac{\Theta}{3-2F} \]

MPFM Predictions

F-Θ Relation:

\[ \beta_\theta = 1 - \frac{(9-8F-F^2)}{5\Theta^2} \]

Resistive Voltage:

\[ V_R = V_\phi - L \frac{dl_\phi}{dt} + M \frac{dl_\theta}{dt} - A V_\theta \]

where

\[ L = \frac{\mu_0 R_0}{120} [31 + \frac{4}{\Theta} \sqrt{(6-6F)(3-2F)}] \]
\[ M = \frac{\mu_0 a}{20\Theta} \left[ 13 - 12F + \frac{2\Theta (5-4F)}{\sqrt{(6-6F)(3-2F)}} \right] \]

\[ A = \frac{R_o}{10a} \left[ \frac{2(6-5F)}{\sqrt{(6-6F)(3-2F)}} + \frac{24-13F}{\Theta} \right] - \frac{R_o F}{a\Theta} \]
COUPLING COEFFICIENT AS A FUNCTION OF
MUTUAL INDUCTANCE AS A FUNCTION OF $\Theta$

\[ \frac{M}{\mu_0 a} \]

$\beta_\Theta = 0$

$\beta_\Theta = 1$
Electrical Circuit Equations

\[ \frac{dV_\phi}{dt} = -\frac{l_\phi}{C_p} \]

\[ \frac{dl_\phi}{dt} = \frac{1}{L} \left[ V_\phi - V_R + M \frac{dl_\theta}{dt} - A \frac{d\Phi}{dt} \right] \]

\[ \frac{d\Phi}{dt} = -L_T \frac{dl_\theta}{dt} - R_T l_\theta + V_T \]

\[ \frac{dl_\theta}{dt} = \frac{(V_T - l_\theta R_T)(27 - 12 l_1 L / \Phi) + 10 L (V_R l_\phi - U_p / \tau) / \Phi - 15 (V_\phi - V_R) R_0 \Theta / a}{15 (A L_T + M) R_0 \Theta / a - 12 L (l_\phi L_T / \Phi - 1) + 3 FL + 18 L_T} \]
SOLUTIONS OF CIRCUIT EQUATIONS FOR MST

- $U_p$ (kJ)
- $\beta_o$
- $\Theta$
- $F$
- Flux (Wb)
- $V_o$ (V)
- $I_o$ (kA)

Time (ms)
Linear Stability

The circuit equations are linearly stable over the usual experimental range:

\[ i \omega \tau \equiv \beta_0/3 - 1 \]

Perturbations damp on the time scale of the plasma energy confinement time.
